

Best tips for responsive design in CSS

Use em/rem

Display FLEX

1. Use em/rem

em → Relative to the font size of its
direct or nearest parent

rem → Relative to the HTML (root)
font-size

Always try to use em/rem instead of
px, so the images/text will adjust with
respect to the device width.

2. display FLEX

Using flex-wrap: wrap, your content in HTML tag like `<div>`, `<p>` will wrap in multiple lines.

3. box-sizing

Using box-sizing: border-box on HTML elements with percentage width will take padding into account rather than adjusting width due to padding.

box-sizing: border-box

4. Media Query

Using media query you can add a breakpoint where certain parts of the design will behave differently on each side of the breakpoint.

```
@media only screen and (max-width: 600px) {  
  body {  
    background-color: lightblue;  
  }  
}
```
